

Development System Reference Manual

Version 10.0

Stephen Moss

20/12/2021

The information contained within this documentation is based on the original Atari documentation © 1994 Atari Corporation and subsequently released into the public domain by Hasbro Interactive but updated and amended for 2020 and beyond.

Acknowledgments

I would like to thank the following people for helping with this project...

- **Starcat:** for distributing the original documentation upon which these updates were based.
- **Glenn Bruner:** for allowing me to use the files he produced during his efforts at re-drafting the documentation.
- **Tursi:** for help with SkunkBoard related sections/information.
- **BelBoz:** for help with installation and setup information for his development tools.
- **Shamus:** for help with information about RMAC/RLN and Virtual Jaguar.
- **CyranoJ & gnn:** for help with information about JagStudio (formerly RB+), Jiffi & the Raptor API.
- **omf:** for information regarding Jaguar Cartridges.
- Anyone else who has taken the time to proofread the drafts and point out any errors (mine or Atari's) or otherwise helped who I may have forgotten over the long years of this project.

Reading the revised Documents

The revisions only contain information relevant to the standard retail console, CD Unit and commonly available accessories, the text within them may be in one of the following colours...

Brown: Text of this colour indicates information that may be inaccurate or no longer relevant and thus maybe subject to subsequent change or removal in a later revision.

Purple: Text of this colour indicates either new, additional information or passages where significant changes to the original text have been made so that the meaning of the original information has been changed.

Black: Text of this colour is either copied verbatim from the original documentation or has had minor grammatical alterations which have not altered the meaning of the original text.

Notes:

- 1) The underlined document titles listed here are links, left clicking them will open the relevant PDF. Additionally, the Table of contents in the updated documents are also links and left clicking them will take you to the relevant section of the document.
- 2) Some early incomplete versions of the revised TechRef documentation that were originally intended to be seen by a select few for review and feedback may have subsequently got out into the wild. Consequently, any revised Jaguar development documentation written by me (Stephen Moss) and dated prior to the year 2020 should be considered to be inaccurate and so **should not** be used, even if it has a higher version number. If you have a copy of any such documentation or otherwise come across it somewhere on the internet, please delete it/request it be taken down as applicable to avoid any confusion.
- 3) The updated documents mention certain 3rd party/aftermarket development software and hardware. These are provided for your convenience and their inclusion should not be construed as an indorsement of any of the items mentioned as the author may have no prior experience of using them.
The author received no rewards or incentive of any kind to include or exclude a particular item.
- 4) The "Other Documents" folder contains copies of the original 1995 version of the modified documentation. It also contains older Jaguar Documentation that may be of some general interest.
Note: Although the TechRef V8 document is a later version number than the Atari 1995 SoftRef document, its contents and included copyright dates clearly indicate that it is based on an older version of the documentation.

GASM & LTXCONV

Utilities

AR68 Archive Utility

The AR68 program creates object module archive library files that can be used with the ALN linker.

DUMP Utility

SIZE Utility

The SIZE utility analyzes an executable program file or object module file and prints information about the sizes and load addresses of the various program segments, and optionally a list of the symbols defined within the file.

FILEFIX Utility

Breaks down an executable program file into separate files for the TEXT, DATA, and symbol table segments, and outputs a script file to load them into the Alpine Board.

STRIP Utility

Removes symbols from an executable program file

FGREP Utility

Fast General Regular Expression Parser. This program will search text files for a specified string pattern and tell you which files match or not.

LS Utility

This is a UNIX-style list-files utility which has some options the standard DIR' command does not.

MAKE Utility

This is a utility used to build your program files from your source code files by compiling only those files which have been changed since they were previously compiled.

GULAM Shell

The GULAM shell is a UNIX C-Shell clone for the Atari computer, which normally has no standard command line shell.

3DS2JAG Utility

The 3DS2JAG Utility converts AutoCAD 3D Studio objects into a format that can be used with the 3D Graphics libraries. (See the Libraries chapter.)

PARSE Utility

The PARSE utility converts standard MID! files to work with the Jaguar Music Driver. (See the **Libraries** chapter.)

SNDCOMP Utility

The SNDCOMP utility compresses digital sound samples. (See the Libraries chapter.)
